General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

PEARSON EDEXCEL IAL MATHEMATICS

General Instructions for Marking

1. The total number of marks for the paper is 75
2. The Edexcel Mathematics mark schemes use the following types of marks:
 - **M** marks: Method marks are awarded for 'knowing a method and attempting to apply it', unless otherwise indicated.
 - **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
 - **B** marks are unconditional accuracy marks (independent of M marks)
 - Marks should not be subdivided.
3. Abbreviations

These are some of the traditional marking abbreviations that will appear in the mark schemes.

- bod – benefit of doubt
 - ft – follow through
 - the symbol \surd will be used for correct ft
 - cao – correct answer only
 - cso - correct solution only. There must be no errors in this part of the question to obtain this mark
 - isw – ignore subsequent working
 - awrt – answers which round to
 - SC: special case
 - o.e. – or equivalent (and appropriate)
 - d... or dep – dependent
 - indep – independent
 - dp decimal places
 - sf significant figures
 - * The answer is printed on the paper or ag- answer given
 - \square or d... The second mark is dependent on gaining the first mark
4. All A marks are 'correct answer only' (cao), unless shown, for example, as A1ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft, but manifestly absurd answers should never be awarded A marks.
 5. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected.

6. If a candidate makes more than one attempt at any question:
 - If all but one attempt is crossed out, mark the attempt which is NOT crossed out.
 - If either all attempts are crossed out or none are crossed out, mark all the attempts and score the highest single attempt.
7. Ignore wrong working or incorrect statements following a correct answer.

General Principles for Further Pure Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles)

Method mark for solving 3 term quadratic:

1. Factorisation

$(x^2 + bx + c) = (x + p)(x + q)$, where $|pq| = |c|$, leading to $x = \dots$

$(ax^2 + bx + c) = (mx + p)(nx + q)$, where $|pq| = |c|$ and $|mn| = |a|$, leading to $x = \dots$

2. Formula

Attempt to use the correct formula (with values for a , b and c).

3. Completing the square

Solving $x^2 + bx + c = 0$: $\left(x \pm \frac{b}{2}\right)^2 \pm q \pm c = 0$, $q \neq 0$, leading to $x = \dots$

Method marks for differentiation and integration:

1. Differentiation

Power of at least one term decreased by 1. ($x^n \rightarrow x^{n-1}$)

2. Integration

Power of at least one term increased by 1. ($x^n \rightarrow x^{n+1}$)

Note that (b) is hence so must involve use of the reduction formula so a direct attempt at I_5 scores no marks.
 However some candidates may apply the reduction formula once as in Way 1 and then attempt I_3 directly, in which case all marks are available as the reduction formula has been used but there must be a credible attempt at I_3 to reach an expression of the required form.

See below for an example:

with $x = f(\theta)$ where f is any trigonometric or hyperbolic function.

The first M mark can be scored if they reach something that is clearly directly “integrable”.

This will be hard to achieve for some choices like $x = \cosh \theta$

Award the first A if the integration is correct - so that requires $\int 1 dx = x$ as well if

$\int \left(1 + \frac{2x^2}{1-x^2} \right)$ is being attempted.

The dependent M can be awarded if there is evidence that the given limits have been applied. So score M0 if their integration has led to something that is defined outside of the limits (such as $\operatorname{arcosh} x$ or $\operatorname{arcoth} x$). Then A1 for the correct answer.

Question Number	Scheme	Notes	Marks
9	$\frac{x^2}{25} + \frac{y^2}{16} = 1, \quad (5 \cos \theta, 4 \sin \theta)$		
(a)	$\frac{dx}{d\theta} = -5 \sin \theta, \quad \frac{dy}{d\theta} = 4 \cos \theta$ or $\frac{2x}{25} + \frac{2y}{16} \frac{dy}{dx} = 0$ oe or $\frac{dy}{dx} = -\frac{4x}{25} \left(1 - \frac{x^2}{25}\right)^{-\frac{1}{2}}$ oe	Correct derivatives or correct implicit differentiation or correct explicit differentiation.	B1
	$\frac{dy}{dx} = \frac{4 \cos \theta}{-5 \sin \theta}$	Divides their derivatives correctly or substitutes and rearranges	M1
	$M_N = \frac{5 \sin \theta}{4 \cos \theta}$	Correct perpendicular gradient rule – may be implied when they form the normal equation.	M1
	$y - 4 \sin \theta = \frac{5 \sin \theta}{4 \cos \theta} (x - 5 \cos \theta)$	Correct straight line method (any complete method). Must use their gradient of the normal.	M1
	$5x \sin \theta - 4y \cos \theta = 9 \sin \theta \cos \theta^*$ or $9 \sin \theta \cos \theta = 5x \sin \theta - 4y \cos \theta^*$	Achieves the printed answer with no errors and allow this answer to be obtained from the previous line. Allow $5 \sin \theta x$ for $5x \sin \theta$ and $4 \cos \theta y$ for $4y \cos \theta$.	A1*
	Allow all marks if the gradient is seen as a function of x and y initially (even in the straight line equation) as long as this is recovered correctly.		
	Solutions that do not use calculus e.g. just quoting the equation of the normal as $y - 4 \sin \theta = \frac{5 \sin \theta}{4 \cos \theta} (x - 5 \cos \theta)$ send to review however if they just quote e.g. $ax \sin \theta - by \sin \theta = (a^2 - b^2) \sin \theta \cos \theta$ and then write down the given result this scores no marks. But we would accept $\frac{dy}{dx} = \frac{4 \cos \theta}{-5 \sin \theta}$ to be quoted for a full solution.		
(b)	$b^2 = a^2 (1 - e^2) \Rightarrow 16 = 25 (1 - e^2) \Rightarrow e = \frac{3}{5}$ F is $(ae, 0) = \left(5 \times \frac{3}{5}, 0\right)$ Or e.g. " $c'^2 = a^2 e^2 = a^2 - b^2 = 25 - 16 \Rightarrow a^2 e^2 = 9 \Rightarrow ae = \dots$ Fully correct strategy for F (must be numerical so $(5e, 0)$ is M0	M1	
	$(3, 0)$	Correct coordinates. $(\pm 3, 0)$ scores A0	A1
			(2)

(c)	$x = \frac{9}{5} \cos \theta$	Correct x coordinate (of Q)	B1
	$PF^2 = (5 \cos \theta - 3)^2 + (4 \sin \theta)^2$ or $PF = \sqrt{(5 \cos \theta - 3)^2 + (4 \sin \theta)^2}$	Correct application of Pythagoras to find PF or PF ² . Their “3” should be positive but allow work in terms of e e.g. “5e”.	M1
	$= 25 \cos^2 \theta - 30 \cos \theta + 9 + 16 \sin^2 \theta$ $= 25 \cos^2 \theta - 30 \cos \theta + 9 + 16(1 - \cos^2 \theta)$	Applies $\sin^2 \theta = 1 - \cos^2 \theta$ to obtain a quadratic expression in $\cos \theta$. If the correct identity is not seen explicitly then their working must imply that a correct identity has been used. Depends on the previous M.	dM1
	$PF = \pm(5 - 3 \cos \theta)$ $PF^2 = 9 \cos^2 \theta - 30 \cos \theta + 25$	Correct expression for PF or PF ² in terms of $\cos \theta$ with terms collected.	A1
	<p>Note that an alternative to using Pythagoras to find PF is to use $PF = ePM$ where M is the foot of the perpendicular from P to the positive directrix.</p> <p>Score M1 for $x = \frac{a}{e} = \frac{5}{3} \left(= \frac{25}{3} \right)$ (not $\pm \frac{25}{3}$)</p> <p>and dM1A1 for $PF = ePM = \frac{3}{5} \left(\frac{25}{3} - 5 \cos \theta \right)$</p>		
	$\frac{ QF }{ PF } = \frac{3 - \frac{9}{5} \cos \theta}{5 - 3 \cos \theta} = \frac{3 \left(1 - \frac{3}{5} \cos \theta \right)}{5 \left(1 - \frac{3}{5} \cos \theta \right)}$ <p>or e.g. $\frac{3}{5} \times \frac{1 - \frac{3}{5} \cos \theta}{1 - \frac{3}{5} \cos \theta} = \frac{3}{5} = e^*$</p> <p>or e.g.</p> $\frac{QF^2}{PF^2} = \frac{\left(3 - \frac{9}{5} \cos \theta \right)^2}{9 \cos^2 \theta - 30 \cos \theta + 25} = \frac{9 - \frac{54}{5} \cos \theta + \frac{81}{25} \cos^2 \theta}{9 \cos^2 \theta - 30 \cos \theta + 25}$ $= \frac{9 \left(1 - \frac{6}{5} \cos \theta + \frac{9}{25} \cos^2 \theta \right)}{25 \left(1 - \frac{6}{5} \cos \theta + \frac{9}{25} \cos^2 \theta \right)}$ <p>or e.g. $= \frac{9}{25} \times \frac{1 - \frac{6}{5} \cos \theta + \frac{9}{25} \cos^2 \theta}{1 - \frac{6}{5} \cos \theta + \frac{9}{25} \cos^2 \theta} = \frac{9}{25} \Rightarrow \frac{QF}{PF} = \frac{3}{5} = e^*$</p> <p>Fully correct working including factorisation or equivalent leading to showing that $\frac{ QF }{ PF } = e$ with no errors and a conclusion “= e”.</p> <p>Note that the value of e must have been seen earlier e.g. in part (b) or calculated independently somewhere in the question.</p> <p>Note that this mark depends on a ratio where the numerator and denominator are either both positive or both negative or modulus symbols are present throughout. This does not apply to the second case as both numerator and denominator must be positive as they are squared.</p>
